

Bhavana Pasula
+1 (840) 206-2098||chinnupasula123@gmail.com|| [linkedIn](#)
Senior Java full stack developer

PROFESSIONAL SUMMARY:

- 8+ years designing, developing, and deploying enterprise-grade applications using Java, Spring Boot, and modern frontend frameworks
- Built scalable microservices with Spring Cloud, and delivered event-driven systems using Kafka, RabbitMQ, and ActiveMQ
- Developed responsive single-page applications (SPAs) with React and Angular, focused on performance and user experience
- Strong polyglot persistence experience: solution design across SQL (Oracle, MySQL, PostgreSQL) and NoSQL (MongoDB, Cassandra, Couchbase) databases
- Deployed cloud-native applications on AWS, Azure, and GCP, leveraging Docker and Kubernetes for containerization and orchestration
- Established and maintained CI/CD pipelines using Jenkins and GitLab, automating builds, tests, and production deployments
- Practiced TDD using JUnit, Mockito, and TestNG, consistently driving high-quality releases and strong code coverage
- Implemented end-to-end logging and monitoring with ELK Stack, Splunk, and APM tools to improve observability and incident response
- Strong Agile/Scrum contributor, leading sprint ceremonies and collaborating effectively with product, QA, DevOps, and business stakeholders
- Optimized application performance by reducing latency and improving scalability through caching strategies and database tuning
- Designed secure and reliable RESTful APIs, applying security best practices and ensuring resiliency and system reliability
- Demonstrated leadership through mentoring junior developers, conducting code reviews, and promoting software engineering best practices across teams

TECHNICAL SKILLS:

Programming Languages	Java (8/11/17), JavaScript, TypeScript, Python, SQL, PL/SQL
Frontend	React.js, Angular, Redux (Thunk, Saga, Toolkit), Apollo Client, NgRx, HTML5, CSS3, Tailwind CSS, Material-UI, PrimeNG, Bootstrap, Jest
Backend	Spring Boot, Spring Cloud (Eureka, Feign, Config Server), Spring Security, Spring MVC, Spring Data JPA, Spring AOP, Hibernate, Node.js, Express.js, GraphQL (Netflix DGS), WebSocket
Databases	MySQL, PostgreSQL, MongoDB, Couchbase, Oracle, Redis, Apache Cassandra, Azure Cosmos DB
Messaging & Streaming	Apache Kafka, Kafka Streams, RabbitMQ, Azure Service Bus.
Monitoring & Logging	ELK Stack, Prometheus, Grafana, Fluentd, Log4J, CloudWatch.
CI/CD & DevOps	Jenkins, GitLab CI/CD, Azure DevOps, Docker, Kubernetes, TestContainers
Cloud Platforms	AWS (EC2, S3, Lambda, API Gateway, RDS, EKS, CloudWatch), Azure (App Services, AKS, Cosmos DB), GCP
Testing & Automation	JUnit, Mockito, TestContainers, Spock, Selenium, Postman, RestAssured
Version Control	Git, GitHub, GitLab, Bitbucket

PROFESSIONAL EXPERIENCE

Client: Fannie Mae, San Antonio, TX

Oct 2023 - Present

Role: Java Full stack Developer

Roles & Responsibilities:

- Designed and built Spring Boot microservices to support loan eligibility checks, rule validation, and decision workflows, improving scalability and release velocity.
- Implemented REST APIs with standardized request/response models, versioning, and error handling; published OpenAPI/Swagger documentation to streamline consumer onboarding.
- Developed a single-page application using React (Redux, TypeScript) with reusable UI components, improving usability for internal operations teams.
- Integrated event-driven processing using Kafka to handle asynchronous loan events (validation completed, decision generated, audit recorded), improving throughput and decoupling services.
- Implemented Spring Security with OAuth2/JWT-based authentication and fine-grained authorization (role/permission-based access) aligned to enterprise security policies.
- Built data access layers using Spring Data JPA/Hibernate with optimized queries and indexing strategies; improved query performance for large datasets.
- Implemented caching (Redis) for frequently accessed reference data (product rules, policy thresholds), reducing database load and improving response times.
- Added resiliency patterns (timeouts, retries, circuit breakers via Resilience4j) to improve reliability across downstream integrations.
- Containerized services using Docker and deployed on Kubernetes, using ConfigMaps/Secrets and health probes to support production readiness.
- Established CI/CD pipelines using Jenkins/GitLab, enforcing quality gates with SonarQube, automated unit/integration testing, and automated deployments.
- Implemented centralized logging and monitoring with ELK/Splunk and metrics dashboards (Prometheus/Grafana) to reduce incident triage time.
- Collaborated in Agile/Scrum ceremonies, participated in design reviews, and conducted code reviews to enforce standards and best practices.

Environment: Java 11/17, Spring Boot, Spring Cloud, Spring Data JPA, Spring Security, Hibernate, REST APIs, Kafka, Redis, PostgreSQL/Oracle, React, Redux, TypeScript, Docker, Kubernetes, Jenkins/GitLab, ELK/Splunk, SonarQube, Terraform

Client: Franklin Templeton, San Mateo, CA

Aug 2021 – Sep 2023

Role: Java Full stack Developer

Roles & Responsibilities:

- Designed and implemented microservices using Java and Spring Boot, standardizing investment portfolio management and transaction processing workflows.
- Developed RESTful APIs integrating Angular 12 and React 17 frontends with backend services, ensuring consistent data flow, standardized contracts, and a seamless user experience across financial applications.
- Built Quarkus microservices optimized for minimal startup latency and efficient resource management, supporting high-throughput trade and portfolio endpoints.
- Designed and managed real-time data pipelines using Kafka Streams, enabling continuous event-driven processing and reliable propagation of trading and portfolio events.
- Leveraged Google Pub/Sub messaging for asynchronous service communication, enabling a decoupled, scalable microservices architecture and reliable event-driven processing.
- Applied Redis caching strategies to accelerate retrieval of frequently accessed financial datasets, improving backend responsiveness and application stability.

- Managed a polyglot database ecosystem with MongoDB, Cassandra, and PostgreSQL, balancing transactional integrity with horizontal scalability and high availability.
- Containerized microservices using Docker and orchestrated deployments on Kubernetes (GKE), ensuring resilient, cloud-native service delivery and operational consistency.
- Automated cloud infrastructure provisioning using Terraform, creating reproducible, compliant, and version-controlled environments for microservices deployments.
- Implemented CI/CD pipelines with GitHub Actions, streamlining build, test, and deployment workflows to improve reliability and reduce manual intervention.
- Developed comprehensive unit and integration tests with JUnit, ensuring service reliability and preventing regressions in critical investment and portfolio workflows.
- Monitored application and microservice performance using Prometheus and Stackdriver, proactively detecting bottlenecks, anomalies, and failures in production.
- Applied security best practices with Spring Security by implementing role-based access control, safeguarding sensitive financial and investment data, designing reusable service modules for portfolio reporting, trade reconciliation, and compliance to standardize patterns and reduce feature delivery time, collaborating cross-functionally to translate business requirements into technical designs aligned with investment objectives, and mentoring junior developers on Java, Spring Boot, Quarkus, and full-stack best practices to improve team productivity and code quality.

Environment: Java, Spring Boot, Quarkus, Microservices, Kafka Streams, Angular 12, React 17, Redis, MongoDB, Cassandra, PostgreSQL, Docker, Kubernetes (GKE), Google Cloud Functions, Pub/Sub, Terraform, GitHub Actions, Prometheus, Stackdriver

Client: ClearDATA, Austin, TX

Dec 2019 – July 2021

Role: Java Full stack Developer

Roles & Responsibilities:

- Developed scalable appointment and billing workflows using React (TypeScript) and Java 17 Spring Boot microservices, supporting scheduling, invoicing, and reporting modules.
- Built REST APIs with consistent validation and error handling patterns, and maintained API documentation using OpenAPI/Swagger for improved integration clarity.
- Implemented asynchronous workflow integration using Kafka to decouple appointment lifecycle events from billing, notification, and reporting services.
- Improved message processing reliability using consumer idempotency, deduplication, and failure-handling patterns to avoid double invoicing or duplicate notifications.
- Implemented database design and performance optimizations in PostgreSQL (AWS RDS) including indexing and query tuning for calendar-based searches and reporting aggregates.
- Delivered React UI screens for scheduling, invoices, payments, and operational dashboards with role-based access and pagination/filtering.
- Implemented secure document storage for invoices using Amazon S3 with pre-signed URLs and encryption, supporting controlled access and audit needs.
- Containerized and deployed services using Docker on AWS ECS Fargate behind an Application Load Balancer for high availability and scalability.
- Implemented centralized logging/monitoring using CloudWatch, enabling faster root-cause analysis and operational visibility.
- Built CI/CD pipelines using Jenkins and GitHub, integrating unit tests and automated deployments.
- Practiced Agile delivery and applied unit testing with JUnit 5/Mockito and frontend testing with Jest/React Testing Library.

Environment: React, TypeScript, Java 17, Spring Boot Microservices, Spring Security, REST APIs, OpenAPI/Swagger, Kafka, PostgreSQL, AWS ECS Fargate, AWS RDS, Amazon S3, AWS CloudWatch, ALB, Docker, Jenkins, GitHub, CI/CD, JUnit 5, Mockito, Jest, React Testing Library, Agile/Scrum, TDD.

Client: Atlantic Union Bank, Richmond, VA

June 2018 – Dec 2019

Role: Java Developer

Roles & Responsibilities:

- Designed and developed banking fraud workflows using Java 17, Spring Boot microservices, Angular, and Kafka to support alert triage, case management, and audit tracking.
- Implemented service boundaries and integration patterns across ingestion, scoring, alerting, case workflow, and reporting services to improve maintainability and independent deployments.
- Built secure APIs with Spring Security, JWT, and RBAC, enforcing role-based access for analysts, supervisors, and administrators.
- Developed fraud scoring and decision support logic using configurable rule evaluation, enrichment, and reason codes to prioritize analyst queues.
- Implemented Kafka producers/consumers for event-driven orchestration between services and ensured reliability using idempotent consumers and deduplication strategies.
- Added resilience patterns for messaging workflows including retry handling and dead-letter routing for failure scenarios and operational recoverability.
- Designed and optimized data persistence using Azure SQL Database, including indexing, query tuning, and performant queue views for case search and dashboards.
- Delivered Angular UI modules for analyst queues, case details, action history, and evidence capture with filtering and pagination.
- Containerized services with Docker and deployed to Azure AKS, integrating configuration and secrets via Azure Key Vault.
- Implemented observability with structured logging, correlation IDs, and monitoring using Azure Monitor/Application Insights to support production troubleshooting.
- Automated build and deployment using Jenkins and GitHub, integrating unit tests, packaging, and environment-based releases.
- Followed Agile/Scrum practices and applied TDD for business-critical components using JUnit 5/Mockito (backend) and Jasmine/Karma (frontend).

Environment: Angular, TypeScript, Java 17, Spring Boot Microservices, Spring Security, JWT, RBAC, REST APIs, JPA/Hibernate, Kafka, Azure SQL Database, Azure AKS, Azure Key Vault, Application Insights, Azure Monitor, Docker, Jenkins, GitHub, CI/CD, JUnit 5, Mockito, Jasmine/Karma, Agile/Scrum, TDD

Client: AjnaLens, Maharashtra IN

June 2016 – May 2018

Role: Java Developer

Roles & Responsibilities:

- Developed an order orchestration platform using React and Java 17 Spring Boot microservices on AWS, supporting checkout, payments, inventory, shipping, and order tracking.
- Implemented asynchronous workflows using RabbitMQ (Amazon MQ) to decouple services and ensure reliable processing across the order lifecycle.
- Designed microservices for Order, Payment, Inventory, Shipping, and Notification with REST APIs secured via Spring Security (JWT, RBAC).
- Built order state management with consistent status transitions driven by downstream events and service acknowledgements.

- Implemented messaging reliability patterns including retries, dead-letter queues, and idempotent consumers to prevent duplicate processing and maintain data consistency.
- Designed persistence using PostgreSQL (AWS RDS) and optimized queries/indexes for order history, customer lookups, and operational reporting.
- Containerized services with Docker and deployed on AWS ECS Fargate behind an Application Load Balancer, with centralized logging and metrics in CloudWatch.
- Automated CI/CD using Jenkins + GitHub, integrated unit testing with JUnit 5/Mockito, and managed secrets via AWS Secrets Manager with structured logging and correlation IDs for traceability.

Environment: React, TypeScript, Java 17, Spring Boot Microservices, Spring Web (REST APIs), Spring Security (JWT, RBAC), Spring Data JPA/Hibernate, RabbitMQ, Amazon MQ , PostgreSQL, AWS RDS, AWS ECS Fargate, Application Load Balancer, AWS CloudWatch, AWS Secrets Manager, Amazon S3, Docker, Jenkins, GitHub, CI/CD, JUnit 5, Mockito, Agile/Scrum.

EDUCATION

- Master of Science (M.S.) in Computer Science from California State University, San Bernardino, CA
- Bachelor of Technology (B. Tech) in Computer Science Engineering from Ace Engineering college, Hyderabad, Telangana, India

Certifications

- AWS Certified Solutions Architect – Associate
